~JSAPI

```
variant FB::JSAPI::Invoke ( const std::string &          methodName,  
                           const std::vector< variant > & args      pure virtual  
                           )
```

Called by the browser to invoke a method on the **JSAPI** object.

Parameters

methodName Name of the method.
args The arguments.

Returns

result of method call

Implemented in **FB::JSAPIAuto**, **FB::JSAPIProxy**, **FB::JSAPISimple**, and **FB::Npapi::NPObjectAPI**.
